

A Solution to Indoor Pollution

George E. Meinig, D.D.S., F.A.C.D.

What Kind of Air are you Breathing???

One of the most important nutrients to humans is often neglected and forgotten. That is AIR. Even nutritionists rarely mention the quality of air and its relationship to health.

Research studies by a division of NASA's Astronaut program have shown that indoor air pollution in homes and offices has reached serious proportions and is responsible for many different kinds of illnesses.

Homes today are built to be airtight in order to save fuel in the winter and to keep us cool in summer. Present air filtration systems primarily recirculate the same stale polluted air. Unfortunately, this allows micro-organisms that are abundant all around us to develop.

The ones that appear to cause the most problems for humans are molds, mites, spores, bacteria, viruses, and fungi. Most of these tiny invisible organisms are so active that they increase in unbelievable numbers. This is particularly so in airtight homes and offices.

While the public is well aware of the presence of microscopic organisms, they have trouble accepting the prevalence of bugs they can't see as being present in their homes and offices. This difficulty can be made to seem plausible when they are informed that at times such organisms clump together allowing their accumulation to become visible to the naked eye. The mold on a piece of bread or cheese is a good example, as is the white fungus plaque that grows on the tongue during illness.

The presence of organisms, along with that of pollen, can result in a host of respiratory illnesses such as asthma, some allergies, emphysema, bronchitis, hay fever, runny noses, fungus infections and others. This is why the result of these airborne diseases is now called "The Sick House Syndrome."

Many victims of these conditions have turned to house filters in the hopes of controlling their problem. Unfortunately, the density of the best filters is not closely enough knit to trap the organisms that are responsible for the majority of these difficulties.

Another common problem that scores of people complain about is to awaken after eight hours of sleep only to find themselves in a complete state of fatigue. One reason for the frequently occurring chronic fatigue syndrome lies in the large number of airborne organisms, molds, mildew and bedding mites that are inhaled with every breath one takes during sleep.

The introduction of these microscopic pests into the body forces one's immune defense mechanisms to be active all night instead of being at rest. There is also evidence that excessive amounts of contamination restricts the larynx and the lung

important factors as to why one often awakens in a state of fatigue and unrest after what they thought was a good night's sleep.

A new device has recently been patented that efficiently eliminates the causes of these ill health problems. Doctors who have used the air purifier in their homes and reception rooms are excited and enthused about its success. The unit does so by releasing undetectable emissions that deactivate, on contact, bacteria, molds, mites, and other organisms. It is called the "PURIDYNE BIOGENIC AIR PURIFICATION SYSTEM."

The product in itself doesn't cure any disease but by inactivating toxic organisms, it allows defense systems to create their own repair and cure.

It should be mentioned that this unique natural product is particularly helpful to children, full-time mothers and the elderly. In addition, veterinary clinics, doctor's offices and hospitals are much in need of micro-organism control. Greenhouse gardeners have found plant rot and slime molds are eliminated and they are elated at the increase of bloom and the added growth and vigor that takes place.

Odor-causing molds and mildews are eliminated from damp and humid areas such as basements, locker rooms and boats.

Patients in doctors reception rooms are particularly pleased to find that at long last cross contamination from others that are ill is undergoing control.

Here Is How It Works:

A small fan draws air across a cartridge that is saturated with DF-100, a safe, natural product that deactivates organisms when circulated into house or office air.

As the DF-100 travels through the unit, it becomes volatilized and the particles pass a column that places an electric charge upon its molecules causing them to repel one another.

The fan quietly releases the super-charged air into the room. As the particles contact bacteria, mites, viruses, fungi and molds that are floating in the air and are also present on clothing, furnishings, carpeting, walls, etc., they are immediately immobilized.

Whereas traditional filter systems are limited by the amount of air they are able to draw into them, the Puridyne Air Purifier's active agent travels to all parts of a 1200 square foot area, decontaminating not just the room air, but organisms wherever they happen to be. In addition, its action controls the smell of tobacco smoke and any organic odor, and makes room air appear fresh.

We are accustomed to think products having such capabilities must be toxic. It will amaze you to learn that the active ingredient is made from grapefruit seeds. The simplicity of the DF-100 formula makes its promotion seem like an old fashioned snake oil remedy. Nothing could be further from the truth.

The discovery of grapefruit seeds ability to inactivate and kill organisms stems back some 12 years to the work of Dr. Jakob Harich, a physician scientist who has a degree in chemistry. After a number of years of work he developed the active
